March 30, 2017

Overall Status

While there was some bugs in the original hand-in, all of those have been fixed in this re-assignment. Therefore this hand-in passes all the tests in BMTest.java.

Division of Labor

We worked on the project either sitting together at the university or at home remotely working together and spliting tasks when possible. We spent a lot of time trying to make fix pinPage, whereas we found the rest of the functions relative to pinPage, very simple to implement. The work was very evenly divided.

Specification

We were tasked with implementing the following functions for the bufmgr.java

freePage, pinPage, unpinPage, flushPage, flushAllPages, getNumBuffers, getNumUnpinned and pick victim.

freePage should deallocate a page from disk.

Pinpage should pin a page by incrementing the pincnt by 1, or by loading it into the bufferpool if it isnt in the bufferpool already.

Unpinpage should unpin a page, flush it to disk if its dirty and reduce the pincount by 1.

Flushpage should save a page to disk if dirty.

Flushpages should write all pages to disk if they're dirty.

getNumBuffers gets the amount of buffers.

getNumUnpinned gets the number of unpinned pages.

Pickvictim gets the index for the first unpinned page, and returns -1 if all pages in the pool are pinned.

Implementation

Freepage First checks if the page is pinned. If its not, it then deallocates the page from disk.

```
public void freePage(PageId pageno) throws IllegalArgumentException {
    FrameDesc fdesc = pagemap.get(pageno.pid);
    if (debugvalue){
        System.out.println("freeing_page_with_id_"+pageno.pid);
    }
    if (fdesc != null) {
        if (fdesc.pincnt != 0) {
            throw new IllegalArgumentException("The_page_is_pinned.");
        }
        return;
        //throw new IllegalArgumentException( "page does not excists");
    }
    Minibase.DiskManager.deallocate_page(pageno);
}
```

pinpage

```
public void pinPage(PageId pageno, Page page, boolean skipRead) {
```

First we check if the page is already in the bufferpoll if it is we increment the pin counter

```
if (skipRead == PIN_MEMCPY && fdesc.pincnt > 0)

→ throw new IllegalArgumentException(

"Page_pinned; _PIN_MEMCPY_not_allowed");

// Increment pin count, notify the replacer, and wrap the

→ buffer.

fdesc.pincnt++;

replacer.pinPage(fdesc);

page.setPage(bufpool[fdesc.index]);

return;
```

If it isnt we pick a victim, and if there isnt any victims we throw an IllegalStateException.

If we have a non pinned frame we write this page to disk if its dirty.

```
// Pick the frame that is not pinned.

fdesc = Minibase.BufferManager.frametab[frameNo];

// If the frame was in use and dirty, it should write it to

the disk.

if (fdesc.pageno.pid!=INVALID_PAGEID) {

flushPage(fdesc.pageno);

pagemap.remove(fdesc.pageno.pid);
}
```

And if it isnt dirty we copy or read the new page into the bufferpool and update the pagemap.

```
170
                      //read in the page if requested, and wrap the buffer
                      if(skipRead == PIN MEMCPY)  {
                              bufpool [frameNo].copyPage(page);
                      } else {
                              Minibase.DiskManager.read page(pageno, bufpool[
                                  \hookrightarrow frameNo]);
175
                     page.setPage(bufpool[frameNo]);
                     //update the frame descriptor
             fdesc.pageno.pid = pageno.pid;
180
             fdesc.pincnt = 1;
             fdesc.dirty = false;
             // Pin the page and put the updated page in the pagemap.
             pagemap.put(pageno.pid, fdesc);
             replacer.pinPage(fdesc);
185
             }
```

unpinpage

```
public void unpinPage(PageId pageno, boolean dirty) throws

→ IllegalArgumentException {
```

First we check if the page is pinned. if its not we throw an exception.

```
FrameDesc fdesc = pagemap.get(pageno.pid);

if (fdesc = null || fdesc.pincnt == 0) throw new

→ IllegalArgumentException(

"Page_not_pinned;"
);
```

If its in the buffpool we decrement the page counter by 1, and update the pagemap with the new information

```
if (dirty == UNPIN_DIRTY) {
    fdesc.dirty = dirty;
}

// Decrement the pin count, since the page is pinned by one less.

→ Also unpin the page and update the page in the

// pagemap.
fdesc.pincnt --;
replacer.unpinPage(fdesc);
//unpin page.
```

flushpage

```
220 public void flushPage(PageId pageno) {
```

Pickvictim is implemented to return the index for the first element with pincnt 0. and if all elements are in use, it returns -1 to indicate this.

```
@Override
public int pickVictim() {

// Finds the first element in the frametab array, where pin count

is equal to zero and returns it.

for (int i = 0; i < Minibase.BufferManager.frametab.length;

if (Minibase.BufferManager.frametab[i].pincnt == 0) {

return i;

}

// If no pages has zero pins, then it returns -1.

return -1;
```

Testing

Testing this time around was very successful, assuming it passes in the tests where it returns "failed as expected". It reports that test1, test2 and test3 completed successfully.

Appendix

Pickvictim

```
@Override
public int pickVictim() {

// Finds the first element in the frametab array, where pin count

is equal to zero and returns it.

for (int i = 0; i < Minibase.BufferManager.frametab.length;

i ++) {
```

```
if (Minibase. BufferManager.frametab[i].pincnt == 0) {
    return i;
    }
}

// If no pages has zero pins, then it returns -1.
return -1;
```
